Farmer's Quick Guide - Wheat Seed

- 1. Seed treatment:** Treat seed with recommended fungicide before sowing to protect against seed-borne disease.
- 2. Sowing window:** Timely sowing 1-25 November gives the best tillering and grain filling in the Tarai region.
- 3. Seed rate:** 40-50 kg per acre for timely sowing; increase to 50-55 kg for late sowing.
- 4. Spacing:** Keep rows 20-22 cm apart, sowing depth 5 cm.
- 5. Irrigation:** Crown root initiation (20-25 days) is the most critical irrigation. Follow with tillering, jointing, flowering and grain-filling stages.
- 6. Nutrition:** Apply balanced NPK based on soil test.
Split nitrogen: half basal, half at first irrigation.
- 7. Weeds:** Control within 30-35 days of sowing.
- 8. Roguing:** Remove off-type plants before flowering to keep your harvest genetically pure.
- 9. Storage:** Dry grain to 10-12% moisture before storage.
